

Four out of Five Choose GN Otometrics

When newborn babies are having their hearing tested in Danish hospitals the equipment is probably supplied by GN Otometrics: four out of five hospitals in Denmark have GN Otometrics' AccuScreen equipment, selecting it for the precise measurements the equipment provides and because it can perform both of the tests in the national screening program launched in Denmark at the start of the year. From December 2004 until April of this year, GN Otometrics supplied almost 100 AccuScreens to audiology departments and maternity wards at hospitals all over Denmark. The typical hearing test is performed by midwives, laboratory technologists or audiology assistants, and over the past couple of months, GN Otometrics and GN ReSound have trained more than 150 hospital employees in how to test using the equipment. According to initial reports from the screening programs, the combination of precise measuring equipment and intensive training has produced excellent results.
